

CASE STUDY

Asphalt Business

A bitumen and asphalt business that is engaged regularly by local councils for road and construction projects required ISO certification to tender for larger government contracts.

With basic systems and processes in place, meeting the ISO standards for Quality, Safety and Environment was the next step. But finding a suitable platform to implement and maintain their systems while engaging a workforce across multiple projects and sites was a challenge.

Reducing manual data handling and providing staff with access to the system from anywhere were the primary requirements. Having investigated multiple software options, SP+ provided the most efficient platform to keep their systems aligned with ISO requirements in real time, with the added benefit of Microsoft integration – meaning minimal set up and training required for staff.

They used SP+ to:

- **Create** effective and efficient systems ready for certification
- **Integrate** Quality, Safety and Environmental Management Systems in a single platform
- **Engage** staff while working across various sites
