Labour Hire Company

A major labour hire company that places personnel into mining, oil and gas, construction and administrative roles had basic management systems in place, but were not yet meeting ISO standards for certification.

In addition, their business had multiple departments all operating on different software systems – creating inefficiencies across the organisation and significantly increasing tech costs.

As a large organisation with a diverse scope, finding a single solution to meet all their needs seemed unlikely. However, introducing their HSEQ manager to SP+, they immediately saw it had the capabilities they needed for a centralised intranet that could also help manage their systems in an engaging and collaborative environment – rather than individual departments operating in silos. It also ensured they were better prepared and ready for ISO certification.

They used SP+ to:

- **Enhance** collaboration and communication between departments

- **Prepare** their Management Systems for certification

- **Reduce** mounting tech costs by moving to a single solution
